#1 Investigate the current streaming health across the available observability systems. Use Grafana to inspect relevant metrics, logs, alerts, and incidents, and use Confluent Kafka to inspect relevant stream-health events. Correlate the evidence and provide a concise reliability investigation report with: overall health, verified evidence, affected areas, likely cause, viewer impact, and recommended operator actions. Do not invent telemetry.

StreamGuard Live Broadcast Reliability Investigation Report

An investigation into live broadcast telemetry has been completed by correlating active incidents, metric data, log traces, and Kafka events.

1. Overall Health

- Current Status: Severely Degraded (Major Incident)**
- Summary:** The live broadcast stream `main-broadcast` is experiencing severe, recurrent performance degradation. System metrics show massive origin CPU exhaustion and extreme transcoding latencies starting on 2026-08-30 at 09:18:25 UTC. Historical Kafka events show that the stream was completely healthy earlier in the day, but it has since entered a critical state.

2. Verified Evidence

A. Kafka Event Stream (env-zzg5v7, lkcc-0xd5w6p)

- Active Topics:** `stream-health`, `broadcast-incidents`, `continuity-alerts`, and `streamguard-events` are provisioned. `broadcast-incidents`, `continuity-alerts`, and `streamguard-events` are currently empty.
- Stream Health Event:** One historical message was recovered from `stream-health` (partition 3, offset 0) at timestamp 1788069260858 (2026-08-30 05:54:20.858 UTC):

```
{ "event": "stream_health", "status": "healthy", "stream": "main-broadcast", "cpu": 42, "buffering_ratio": 0.3 }
```
- Regional Correlation Analysis:** Regional correlation is not possible as the Kafka event does not contain a `region` or `region_id` field. Comparing Kafka values with Grafana values is restricted to a system-wide overall comparison. This historical event proves that the stream was in an overall healthy,
