Agent Development Kit 2.8.0 streamguard_agent Focus only on Grafana... New Session

Info State Artifacts Evals

Event 36 of 36

Invocation: #1 (Focus only on Grafana observability ...)

#1 Focus only on Grafana observability. Investigate the current streaming health using available Prometheus metrics, Loki logs, alerts, and Grafana incidents. Identify the most important degradation signals and explain what they indicate. Clearly separate verified evidence from hypotheses and do not invent any data.

#36 An investigation into our live streaming telemetry has revealed critical insights regarding the current broadcast degradation. Below is a detailed breakdown of the findings, explaining the technical anomalies in simple terms.

What Happened

- **The Situation:** Our live broadcast is experiencing brief but severe recurring degradation across all regions: **Northeast, Midwest, South, and West.**
- **The Symptoms:** Every 60 seconds (or multiples of 60 seconds), we observe dramatic, synchronized performance drops:
 - **Video Stuttering & Dropped Frames:** Dropped frames jump from a healthy level of under 10 frames per minute to between **100 and 495** dropped frames during a spike.
 - **Broadcasting Errors:** Stream error rates climb from near-zero to **3.1% – 6.89%.**
 - **Viewer Buffering:** The percentage of viewers experiencing buffering spikes from a healthy **<0.8%** up to **5.0% – 8.95%.**
- **The West Region Illusion (Telemetry Aliasing):** Standard monitoring previously indicated the West region was healthy. However, high-resolution telemetry (10-second intervals) disproved this.
 - **Simple Analogy:** This is a classic case of **"telemetry aliasing"** (like a camera shutter matching a helicopter's spinning blades, making them look still). When our monitoring graphs average data over 1-minute intervals, a severe 10-to-50-second freeze is averaged out and looks like a harmless bump. Looking at the raw 10-second resolution reveals that the West region is suffering from the exact same severe, periodic drops.
