Event 110 of 110

Invocation: #5 (Analyze the current streaming degra...)

completely empty, no regional degradation or active alerting information is currently available on the Kafka cluster.

3. Conclusion

Verified Grafana telemetry confirms that the streaming degradation is globally affecting all four regions (Midwest, Northeast, South, and West) in a highly synchronized manner.

Labels on the metrics show that all regions share a single transcoder instance ID (421a0857-dce8-46ac-a76b-528811ed8334). While Confluent Kafka events confirm the global stream baseline was healthy shortly before the failures, they cannot be regionally correlated due to the absence of regional fields and the complete lack of events in Kafka's alert and incident topics.

#109

Analyze the current streaming degradation and determine the most likely root cause. Use Grafana metrics, logs, incidents, and Confluent Kafka events as evidence. Structure the response into: Verified Evidence, Derived Observations, Root Cause Hypothesis, Viewer Impact, and Recommended Operator Actions. Do not present hypotheses as confirmed facts.

#110

1. Verified Evidence

From Grafana Metrics & Loki Logs:

- Architecture: The streaming pipeline runs as service `streamguard-broadcast` on a single, shared central instance ID `421a0857-dce8-46ac-a76b-528811ed8334`.
- Degradation Signals (Recurring Peaks): Metrics show synchronized, recurring performance collapses (occurring on a ~60-second cycle) across all four regions (Midwest, Northeast, South, and West). During these spikes:
 - CPU Usage: Surges to 88% – 96.8% on the shared central instance.
 - Transcode Latency: Climbs from normal levels (~120–200ms) to 700ms – 931ms.
 - Dropped Frames: Spikes to 100 – 495 dropped frames per minute per region.
