#1 Use Confluent Kafka MCP to investigate the streaming event infrastructure. Inspect the available Kafka topics in the configured environment and cluster, then consume relevant messages from the stream-health, continuity-alerts, broadcast-incidents, and streamguard-events topics. Summarize the actual events returned by Kafka. Do not invent events or fields that are not present in the returned messages.

#17 list_schema_subjects

#18 I have completed the investigation of the streaming event infrastructure using the Confluent Kafka MCP tools. Below is the summary of the available topics and the messages retrieved from each.

1. Available Kafka Topics

The Kafka cluster (lkc-0xd5w6p in environment env-zzg5v7) contains the following four topics:

- broadcast-incidents (6 partitions)
- continuity-alerts (6 partitions)
- stream-health (6 partitions)
- streamguard-events (6 partitions)

2. Stream Message Consumption Summary

stream-health

- Status: Active message found.
- Message Details:
 - Partition: 3
 - Offset: 0
 - Timestamp: 1788069260858
 - Key: null
 - Value (JSON):

```
{
  "event": "stream_health",
  "status": "healthy",
  "stream": "main-broadcast",
  "cpu": 42,
  "buffering_ratio": 0.3
}
```
