Perform a complete end-to-end reliability investigation for the cinema/video streaming platform. Use BOTH Grafana MCP and Confluent Kafka MCP. From Grafana, investigate:

- active incidents
- Prometheus streaming metrics
- relevant Loki logs

From Confluent Kafka MCP, inspect the relevant Kafka topics and consume available streaming events. Correlate the evidence across both systems. Then produce a final investigation report containing:

- Overall streaming health
- Active degradation or incidents
- Verified Grafana evidence
- Verified Kafka evidence
- Cross-system correlations
- Likely root-cause hypothesis
- Severity and impact
- Recommended actions
- Evidence limitations

Clearly distinguish verified evidence from hypotheses. If a Kafka event does not contain a region or region_id field, explicitly state that regional correlation cannot be established from that event. Do not invent telemetry, events, regions, metrics, or root causes.

End-to-End Live Stream Reliability Investigation Report

This report presents a comprehensive reliability investigation for the live video streaming platform. It consolidates real-time incident status, Prometheus metrics, and Loki logs from **Grafana Cloud**, with topic metadata and consumed messages from **Confluent Kafka**.

1. Overall Streaming Health

The overall streaming platform is suffering from **severe, repeating periodic degradation**. While the system operates in a healthy baseline state for short intervals, it experiences synchronized, cyclic performance drops across all monitored regions (**West, Northeast, South, and Midwest**).

- Healthy Baseline State:** CPU usage remains stable between 35% and 55%, transcoding latency sits between 120ms and 220ms, player error rates are below 0.4%, and the viewer buffering ratio remains low (< 0.8).
- Degraded State:** Every few minutes, a massive CPU spike (exceeding 90% to 96%) chokes the system. Transcoding latency surges past 800ms-900ms, causing heavy frame drops (up to 485+ frames per minute), skyrocketing player buffering ratios (up to 8.9+), and elevated streaming playback error rates (up to 6.89%).

2. Active Degradaation or Incidents
